### Printing or not printing? Traffic light system & signal light for Microplex printer now available

For many plant manufacturers, a traffic light system or a warning light is indispensable. By means of these lights, the current status of the system is displayed. Such signal lights are now also available for our Microplex printers. The illustrated traffic light system allows the current printing process to be tracked visually. Green stands for „online / ready to print“, yellow for „busy / in printing“ and red for „offline / error“. Thus, any malfunctions can be recognized immediately from afar. The control of the signal lamp can be adapted individually to the needs of the customers.

In addition to the traffic light system, a simple signal lamp is available where e.g. the lights only turn „red“ if there are any errors and otherwise does not send any light signal. The signal lamp can be customised to the needs of the customer. Both versions are available for all Microplex printers. For the traffic light system, the control via the GPIO interface is a basic requirement, while the signal lamp is connected directly via the controller of the printer. Further information will be available shortly on our website and at [info@mpi.com.es](mailto:info@mpi.com.es).
